

MIGRATION FLOW DASHBOARD

Product Information Report

NET MIGRATION PERCENTAGE OF POPULATION PREDICTION

Net Migration equals Immigration minus Emigration flows. Many people move from and to Ireland, creating migration flows which have an effect on the economy as well as businesses and living standards. This dashboard provides you with a simulation environment to predict Irish Net Migration flows based on certain input variables, with which you can estimate next year's numbers to account for a decrease or increase in Migration.

You can do your prediction in 6 simple steps:

Step 1:

Fill in current year Irish GDP.

Step 2:

Fill in last year and current year Irish inflation.

Step 3:

Fill in last year and current year Irish average unemployment.

Step 4:

Fill in current year Irish government surplus/deficit.

Step 5:

Fill in current year Irish net migration percentage of the population.

Step 6:

Click on Predict to get your next year net migration prediction!

How to interpret the results:

The model will give you a prediction of the next year's Irish Net Migration, as a percentage of the population, based on the inputs you gave for the above variables. Additionally, the model produces a 95% confidence interval, meaning that there is a 95% certainty that the true Net Migration estimate lies between the given range.
